

# 4 CHANNEL DUB PREAMP

## Thank you for choosing 4 Channel Dub Preamp!

This preamp is based on traditional sound system preamps; a creative tool for sculpting the sound before it goes on to the power amplifiers riving the speaker boxes.

Each channel has its own volume knob and goes through a filter with peak settings for boosting specific frequencies. The master signal then goes through a 10 band EQ and HP and LP filters.

The Line ins and Top and High Mid channels can be sent to the FX output.

Add sub harmonies with the Sub generator and add saturations with the Saturation circuit.

Crossover frequencies are set with the small trimmers on the back panel.
